**1. You are testing a password reset feature in the browser by entering different email addresses to check if the system sends the reset link to the correct address and displays appropriate error messages for non-existent emails. When asked, what type of testing is this?**

1 White-box testing

2 Black-box testing

3 Performance testing

4 Adhoc testing

**2. Your company has developed a chat application, and the inbox module has been fully implemented with all its functionalities. Your task is to verify that each feature within the inbox is working correctly. However, you do not have access to the client-side server. Which type of testing will you perform?**

1 Regression testing

2 Black-box testing

3 White-box testing

4 Exploratory testing

**3. During the checkout process, the website fails to load the payment options after clicking on "Proceed to Payment." As a tester, which action would provide the most useful information for the development team?**

1 Click the back button and try proceeding to payment again

2 Try using a different web browser to see if the issue persists.

3 Open the developer console to check for any error messages.

4 Abandon the test and report that the payment options are not loading.

**4. Which of the following testing strategies best describes an exploratory test scenario for a mobile phone purchasing website?**

1 Starting with detailed test cases to verify each functionality systematically.

2 Browsing through available mobilephones, selecting a pair, adding them to the cart, and testing cart functions.

3 Conducting load testing to ensure the website can handle peak user traffic.

4 Testing the website across different browsers and devices to ensure compatibility.

**5. During the development of a new e-commerce website, a customer reports that the total price displayed during checkout is incorrect. After investigation, the development team discovered that a piece of code was incorrectly calculating the discount on bulk purchases. How would you classify this issue, and what might have led to it?**

1

The issue is a bug, caused by a failure in the checkout process due to an error in the code logic.

2

The issue is a failure, caused by a bug in the checkout process due to a coding error in the discount calculation.

3

The issue is an error, caused by a bug in the checkout process leading to a failure in the discount calculation

4

The issue is a bug, caused by a coding error in the discount calculation, leading to a failure during checkout.
